Space Research and Defence Development Organisation (**SRDDO**) is a pioneering private-sector enterprise dedicated to advancing global capabilities in **Aerospace**, **Space Technology** and **Defense innovation**. With a mission to enable national self-reliance in strategic technologies, **SRDDO** designs and develops cutting-edge solutions for modern warfare, satellite systems, and next-generation launch platforms.

Vision:

To be India's leading force in indigenous space and defense innovation—delivering scalable, sustainable, and high-impact technologies that safeguard national interests and promote global security partnerships.

Mission:

- To design and develop indigenous, dual-use technologies for Defense and Aerospace applications.
- To collaborate with MoD, DRDO, ISRO, DPSUs and others for co-development, prototyping, and field deployment.
- To enable India's entry into the global defense export market through IP-driven, cost-effective innovations.

Core Focus Areas:

- **Advanced Aerospace Systems:** Compact, reusable, and modular space launch vehicles with VTOL capability, ISRU fuel synthesis, and onboard AI-driven navigation.
- **Defense AI & Tactical Technologies:** Autonomous targeting systems, battlefield analytics, and C4ISR-enabling platforms.
- **Drones & UCAVs:** Long-endurance UAVs with swarm intelligence, surveillance payloads, and combat-readiness.
- **Secure Satellite Comms & ISR:** Indigenous satcom and GPS-alternatives using NAVIC, software-defined radios, and anti-jamming protocols.
- **Simplified Space Docking**: Reducing complexity and speed constraints.

Problem

What's Broken in Modern Space Launch Systems?

- Rockets require expensive and massive launchpads to take off and not feasible to land a complete rocket on another planet without infrastructure.
- Multi-stage rockets use numerous engines, increasing cost and complexity.
- Rockets do not utilize in-situ planetary resources to refuel, limiting sustainability.
- Current docking requires precise speed control – SRDDO simplifies the process with intelligent alignment systems

Solution

Our Game-Changing Innovations:

- Vertical Takeoff and Landing (VTOL) technology allows launch/landing without a pad.
- Modular propulsion system: same engines used for all stages.
- Planetary ISRU (In-Situ Resource Utilization): Rocket synthesizes fuel from local materials.
- Portable docking System implementation
- Technologies designed for both military and civilian use

Market Size

Massive and Expanding Opportunities:

- Global Space Launch Market: $20B+ (growing at 15% CAGR)
- Mars & Lunar Missions: $100B+ long-term value
- Satellite Launch, Planetary Logistics, Deep Space Exploration

Table

Year/Period	Global Revenue	Growth Rate	Profit Margin	Key Trends
2000	~$80B	-	5–7%	Government-led missions
2015	~$330B	~8% CAGR	7–10%	Start of private sector boom
2024 (Now)	~$546B	~9% CAGR	10–15%	Commercial satellites, SpaceX era
2030 (Proj.)	~$900B	~10% CAGR	15%+	Space internet, orbital services
2040 (Proj.)	$1.25–1.75T	~11–13% CAGR	15–20%	Lunar economy, Mars missions

Business Model

- Government Contracts (NASA, ISRO, ESA)
- Private Missions (like SpaceX)
- Tech Licensing (VTOL, ISRU)
- Planetary Logistics

Target Audience and Services

Target : Most of UNO registered and Unregistered countries unable to afford building and relay on other Space Organisations

Services :

- Sending Satellites into the Space.
- Building Wardoms(like Iron, Golden, Diamond).
- To Destruct / Construct Objects in space.
- Making Satellites.
- Providing Engines and Warfares.
- To collect the Space Garbage.
- Space Travelling and Planet Exploration
- Simple Portable Docking System.

Traction

- Prototype and making reusable engine
- Lab-tested ISRU on Mars soil simulant
- Patents filed
- MOUs with research institutions

Marketing Strategy

- Partner with space agencies/startups
- Attend expos/summits
- Publish papers and demos
- Aerospace media coverage

Competition

- SpaceX: Needs launch pad
- Blue Origin: Early ISRU stage
- None of the above have simple Portable Docking
- Our Edge:
  - Pad-less ops
  - Unified propulsion
  - Local fuel synthesis
  - Portable Docking

Financial Management

- **Financial Ask**: $5M Seed Round

Breakdown of Fund Usage:

- **R&D & Prototyping:** 40%
  (VTOL engines, ISRU modules, AI control systems)
- **Infrastructure & Lab Setup:** 20%
  (Simulation environments, component testing, safety compliance)
- **Team & Talent Acquisition:** 15%
  (Aerospace, embedded systems, AI/ML experts)
- **Regulatory & Licensing:** 10%
  (IP filing, certification, industrial licensing, test permits)
- **Market Readiness & Pilot Deployments:** 10%
  (Demo units, military evaluations, space trials)
- **Contingency Reserve:** 5%
  (Emergency runway, risk mitigation)

Category	Allocation	Purpose
R&D & Prototyping	40%	Design, simulate, and build MVPs (VTOL, ISRU, Docking AI)
Infrastructure & Lab Setup	20%	Scalable test facilities, integration with public test sites
Talent Acquisition & Retention	15%	Hire aerospace, propulsion, AI & systems engineering experts
Regulatory & Certification	10%	IP protection, defense & space compliance, safety certification
Pilot Deployment & Client Demos	10%	Working field trials with strategic users (Govt/Private)
Contingency Reserve	5%	Emergency runway, risk mitigation

Revenue(ROI)

Year	Revenue	Gross Profit	EBITDA Margin	Net Profit
Year 1	$300,000	$50,000	-20%	-$600,000
Year 2	$1.2 Million	$400,000	5%	-$100,000
Year 3	$4.5 Million	$2.0 Million	25%	$800,000
Year 4	$12 Million	$6.5 Million	35%	$3.5 Million
Year 5	$25 Million	$15 Million	45%	$9.5 Million

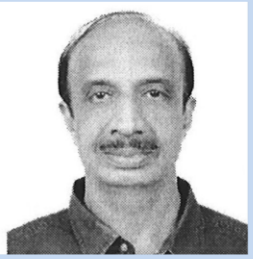
Total 5-Year Revenue: $43 Million

Total 5-Year Net Profit: ~$13.1 Million

Cumulative ROI for Investors: 3.5x to 5x

****Target Revenue of 7-Year:** 50 B+

Our Technical Guides



A R Murali Sankar, Resident Expert (Launch Vehicle System)

A R Murali Sankar, BTech (Mech), MBA (Operations), and Fellow of the Institution of Engineers, served ISRO/VSSC for 33 years in Fabrication & Quality, including as Deputy Project Director for GSLV MkII. He is an expert in Dimensional Metrology, calibration of measuring instruments, and aerospace fastener qualification. He played a key role in developing test methods, procuring equipment, and managing heat/surface treatment facilities. His work includes the realization of launch vehicle hardware, precision components, and large rocket motor cases. He chaired review committees for quality processes and non-conformance, contributed to Gaganyaan mission structures, and led vendor development and process documentation across ISRO's supply chain.

Kaushikkumar Suryakant Parikh, Resident Expert (Satellite System)

K S Parikh, an Electronics & Communication Engineering graduate from M.S. University (1985), joined ISRO's Space Applications Centre in 1986. Over 37 years, he contributed significantly to RF/Microwave system design for INSAT/GSAT payloads, including high-power filters, multiplexers, and test labs. He led the development of GNSS receivers, simulators, and various satellite ground terminals. He guided payload development for GSAT and IRNSS series, holding key roles like Deputy Director (Payloads), Associate Project Director (GSAT-6, IRNSS), and retired as Associate Director (R&D) in 2022. He received the ISRO Merit Award in 2015 and multiple team awards.

Prakasha Rao P J V K S (Skill Development & Satellite System)

Mr. Prakasha Rao PJVKS, retired as Outstanding Scientist from ISRO, served as Director of Space Infrastructure Programme Office & Directorate of Safety, Reliability and Quality at ISRO HQ. He held key roles including Programme Director (LEO & Planetary Platforms), Project Director (GSAT-6/9/17/18), and Associate Project Director (INSAT-3D). He was deputed to Boeing Satellite Systems, USA, and served as Product Assurance Manager for W2M, ISRO's first commercial spacecraft to Europe. He chaired the 75 Student Satellites Mission Committee and "UNNATI" program, and contributed as faculty in ISRO, DRDO, IISc training programs. He was also part of the interim IN-SPACe setup for promoting space activities.

Vinod M Bothale, Resident Expert (Space Applications)

Shri Bothale, retired as Outstanding Scientist and Associate Director, NRSC, after 36 years in ISRO. He was the architect of major geospatial platforms like Bhuvan, India-WRIS, Bhoonidhi, and Maharashtra Geoportal, transforming Bhuvan into India's largest g-Governance platform. He played a key role in ISRO's Disaster Management Program and MHA's Emergency Database, and led ground segment operations for six successful satellite missions. He was conferred with National Geospatial and Geomatics Awards, and multiple team accolades including the Skoch and ISRO Team Excellence Awards. He also contributed to SAR interferometry at DLR-Germany and was Director of MRSAC, Nagpur.

Team

- Gugulothu Linganna –Founder, Scientist, R&D.
- Gugulothu Rahul Nayak– Manager, Marketing.
- Are Jathin – Designer, CAD expert, R&D.

Thank You!

- Let’s Make Sustainable Planetary Travel a Reality.
